

Problem number one

Delete: it is probably obvious by its name that you can delete some part of your code using this command.

Put: when you want to add something to your already existing code you use this command.

Patch: The patch request method applies partial modifications to a resource.

Post: when the user adds some information to your already existing code, and you want to add that data to your site you use this command

Get: when you want to give your user some new information that they request to have.

Answering questions

1.delete

2.post

3.get

4.post

5.put

.....

Problem number 2

“A 5xx code means the problem was caused by the server. With a 5xx code, the request can be present with no changes and you will get the requested result when the server has been fixed. With a 4xx code, typically the client or user has to fix an error before trying again, but there are some exceptions.”
